Field of the Invention The present invention relates to a folding device for switching folding rollers or conveyor belts and, more particularly, to a folding device which is adapted to mechanically provide a folding edge on a moving material. 2. Description of the Prior Art In various types of machines, it is often desirable to provide a folding edge on a continuously moving material, such as a web of paper, cloth, or plastic material, for a variety of purposes. Typically, such a material is advanced over a support surface in a continuous path of movement. A folding device is usually mounted at the forward end of this support surface. The folding device includes a pair of pivotally mounted moving rollers or conveyor belts which are urged toward one another, thereby causing the rollers or belts to pinch the material tightly between them. The material is caused to change its direction of movement and fold back on itself in a zig-zag path as it is moved between the rollers or belts. This action forms a folded edge in the material, which edge could be the edge of a hole or opening in the material. Folding devices of this type can be manufactured with a single set of stationary rollers and a pair of foldably mounted moving rollers, or the movable rollers can be formed by one movable roller and a set of stationary rollers. A number of structures are known for both moving and stationary rollers. The two most common types of rollers are generally referred to as a "cylindrical roller" and a "flat roller". Both types of rollers have a hard, smooth surface to come into contact with the material. One end of each roller is usually fixed to a suitable framework of the structure, while the other end of each roller has a pivot pin or shaft. In the case of a cylindrical roller, the roller has an inside diameter to correspond to a diameter of the material. In the case of a flat roller, there is a generally flat surface of the roller which is adapted to support the material. In the prior art, the pivot pin of the stationary rollers is
